

System Admin with IT Service Management and AI Emphasis ServiceNow

1. Introduction

The Requirements Analysis phase identifies the functional and non-functional requirements needed to automate the standard laptop procurement and configuration process. The proposed system uses **ServiceNow Flow Designer** to automate task creation and assignment after a Standard Laptop request is approved.

The main purpose is to reduce manual intervention, minimize delays and errors, and ensure that approved laptop requests are promptly assigned to the Hardware team for configuration.

2. Functional Requirements

FR1: Standard Laptop Request

The system shall allow users to place a request for a **Standard Laptop** through the ServiceNow Service Catalog.

The user should be able to access:

Service Catalog → **Hardware** → **Standard Laptop** → **Order Now**

This process initiates the laptop procurement request.

FR2: Request Approval

The system shall support an approval process for the Standard Laptop request.

The request must be approved before the automated laptop configuration task is generated. The approval status should be available in the request record.

FR3: Flow Trigger

The system shall use **Service Catalog** as the trigger for the automation flow.

The Flow Designer flow should be configured with a Service Catalog trigger to initiate the automated workflow.

FR4: Automatic Catalog Task Creation

After the required request process, the system shall automatically create a **Catalog Task** for laptop configuration.

The flow shall use the **Create Catalog Task** action and connect it with the Requested Item Record.

FR5: Automatic Task Description

The system shall automatically populate the task information.

The Catalog Task shall contain:

- **Short Description:** Laptop need to Configured
- **Description:** Laptop need to Configured

FR6: Hardware Team Assignment

The system shall automatically assign the generated Catalog Task to the **Hardware** assignment group.

This ensures that the appropriate team receives the laptop configuration task without requiring manual assignment.

FR7: Approval Status

The automated task shall use the approval value **Approved** as specified in the Flow Designer configuration.

This ensures that the workflow handles the approved request appropriately.

FR8: Standard Laptop Flow Assignment

The created flow named “**Standard Laptop Task**” shall be assigned to the **Standard Laptop** Service Catalog item.

The flow is configured through the item's **Process Engine**, replacing the remaining automation with the newly created flow.

FR9: Request Status Tracking

The system shall allow users or IT personnel to view the status of the laptop request.

The request number can be opened to view the request record and its approval information.

FR10: Catalog Task Verification

The system shall provide access to the generated Catalog Task from the Requested Item record.

The task should display the updated short description and assigned group so that the successful execution of the automation can be verified.

3. Non-Functional Requirements

NFR1: Efficiency

The system should reduce the time required to process standard laptop procurement requests by automating repetitive task creation and assignment.

NFR2: Reliability

The workflow should consistently create the required Catalog Task and assign it to the Hardware group when the configured conditions are satisfied.

NFR3: Accuracy

The system should automatically populate the required task fields to reduce manual entry errors.

NFR4: Usability

The Standard Laptop request process should be simple and easy for users to understand through the Service Catalog.

NFR5: Maintainability

The workflow should be implemented using ServiceNow Flow Designer so that the automation can be maintained and modified when required.

NFR6: Productivity

The system should reduce manual intervention and improve resource utilization within the IT department.

4. System Requirements

4.1 Software Requirements

The project requires:

- **ServiceNow platform**
- **ServiceNow Flow Designer**
- **Service Catalog**
- **Hardware Service Catalog category**
- **Standard Laptop Catalog Item**
- **Maintain Items configuration**
- **Catalog Task functionality**

The project specifically uses Flow Designer to create the automated workflow.

4.2 User Requirements

The main users involved in the system are:

1. Laptop Requester

- Access the Service Catalog.
- Select Standard Laptop.
- Place the request.
- View the request status.

2. Approver

- Review the laptop request.
- Approve the request.

3. IT Procurement Team

- Monitor the procurement request.
- Ensure the automated workflow operates correctly.

4. Hardware Team

- Receive the automatically generated Catalog Task.
- Configure the laptop.
- Process the assigned task.

5. Data Requirements

The system requires the following information to process the laptop request:

Data Item	Purpose
Request Number	Identifies the laptop request
Requested Item Record	Connects the request with the Catalog Task
Approval Status	Determines whether the request is approved
Short Description	Identifies the required configuration task
Description	Provides task information
Assignment Group	Identifies the Hardware team
Catalog Task	Represents the laptop configuration activity

The PDF specifically identifies the Requested Item Record, Catalog Task, short description, description, Assignment Group, and Approval fields in the Flow Designer action.

6. Workflow Requirements

The automated workflow shall follow this sequence:

Step 1: User opens Service Catalog.

↓

Step 2: User selects **Hardware** → **Standard Laptop**.

↓

Step 3: User selects **Order Now**.

↓

Step 4: The laptop request is generated.

↓

Step 5: The request goes through the approval process.

↓

Step 6: Once approved, the configured Flow Designer automation processes the request.

↓

Step 7: A Catalog Task is automatically created.

↓

Step 8: The task description is automatically populated as “**Laptop need to Configured.**”

↓

Step 9: The task is automatically assigned to the **Hardware** group.

↓

Step 10: The Hardware team can access the Catalog Task and perform the laptop configuration.

The PDF's implementation steps directly support this workflow through Flow Designer, Standard Laptop flow assignment, and Catalog Task verification.

7. Constraints

The project requirements are based on the following constraints:

- The automation is implemented within **ServiceNow**.
- The workflow uses **Flow Designer**.

- The request is based on the **Standard Laptop** Service Catalog item.
 - The configuration task is assigned to the **Hardware** group.
 - The required task fields are populated according to the configured flow.
 - The remaining automation settings are left at their default values where specified in the project.
-

8. Requirement Summary

Requirement Category	Requirement
Request	User can order a Standard Laptop
Approval	Laptop request can be approved
Trigger	Service Catalog trigger
Automation	Flow Designer
Action	Create Catalog Task
Description	Laptop need to Configured
Assignment	Hardware group
Status	Request and task status can be checked
Integration	Standard Laptop Catalog Item with Flow
Objective	Reduce manual work and delays

9. Requirements Analysis Outcome

The requirements analysis establishes that the proposed system must automate the transition from an approved **Standard Laptop Service Catalog request** to a **Hardware-assigned Catalog Task**. The required workflow is implemented using ServiceNow Flow Designer, with the objective of reducing manual intervention, minimizing delays, improving task allocation, and providing a more efficient IT procurement process.
