

System Admin with IT Service Management and AI Emphasis ServiceNow

1. Introduction

The Design Phase defines how the proposed automated IT procurement system will be structured and how the different components will interact. The project is designed using **ServiceNow Flow Designer** to automate the processing of Standard Laptop requests.

The main design objective is to automatically create a laptop configuration task and assign it to the **Hardware** team after the required approval process. This design addresses the manual effort and delays identified in the existing procurement process.

2. System Design

The proposed system consists of the following major components:

1. **Service Catalog**
2. **Standard Laptop Catalog Item**
3. **Approval Process**
4. **Flow Designer**
5. **Service Catalog Trigger**
6. **Create Catalog Task Action**
7. **Hardware Assignment Group**
8. **Requested Item Record**
9. **Catalog Task**

Laptop Configuration

The PDF specifies the Standard Laptop Service Catalog item and the Flow Designer automation as the core elements of this workflow.

3. Architecture Design

The system follows a workflow-based architecture within ServiceNow.

Architecture Components

Presentation Layer

- ServiceNow Service Catalog
- Standard Laptop request interface

Workflow Layer

- ServiceNow Flow Designer
- Service Catalog trigger
- Automated flow named **Standard Laptop Task**

Task Management Layer

- Requested Item Record
- Catalog Task
- Hardware Assignment Group

Architecture Flow

+-----+

The Flow Designer configuration in the PDF uses a Service Catalog trigger and a Create Catalog Task action.

4. Flow Design

The main workflow is named:

Standard Laptop Task

The flow is configured with:

- **Flow Name:** Standard Laptop Task

- **Application:** Global
- **Run As:** System User
- **Trigger:** Service Catalog
- **Action:** Create Catalog Task

These settings are explicitly specified in the project implementation.

5. Catalog Task Design

The Create Catalog Task action is designed to automatically populate the task with the required information.

Field	Designed Value
Action	Create Catalog Task
Request Item	Requested Item Record
Table	Catalog Task
Short Description	Laptop need to Configured
Description	Laptop need to Configured
Assignment Group	Hardware
Approval	Approved

These field values are based on the Flow Designer action configuration described in the PDF.

6. Service Catalog Design

The Standard Laptop is designed as a Service Catalog item under the Hardware category.

The user accesses:

Service Catalog → Hardware → Standard Laptop → Order Now

This allows the user to initiate the laptop procurement request through the ServiceNow platform.

7. Process Design

The complete process is designed as follows:

Step 1 – Request

The user selects the **Standard Laptop** item from the Hardware section of the Service Catalog.

Step 2 – Order

The user selects **Order Now** to submit the request.

Step 3 – Approval

The request proceeds through the approval process.

Step 4 – Flow Execution

The configured Flow Designer workflow processes the Service Catalog request.

Step 5 – Catalog Task Creation

The flow uses the **Create Catalog Task** action and uses the Requested Item Record for the task.

Step 6 – Task Information

The system automatically adds:

“Laptop need to Configured”

as the short description and description.

Step 7 – Assignment

The system assigns the task to the **Hardware** assignment group.

Step 8 – Configuration

The Hardware team receives the task and can proceed with laptop configuration.

The PDF provides the corresponding configuration and verification process through the Requested Item and Catalog Tasks sections.

8. Flow Assignment Design

The **Standard Laptop Task** flow is associated with the **Standard Laptop Service Catalog item**.

The design requires:

1. Open Maintain Items.
2. Locate the Standard Laptop item.
3. Open the Process Engine configuration.
4. Remove the remaining automation where specified.
5. Add the Standard Laptop Task flow.
6. Save the configuration.

This connects the Service Catalog item to the automated workflow.

9. User Interaction Design

The user interaction is designed to be simple:

The user does not need to manually create a separate Hardware configuration task. The flow is designed to generate that task automatically.

10. Task Verification Design

After the request is processed, the system provides a method for verifying the generated task.

The verification process is:

Request Number

↓

Requested Item

↓

Catalog Tasks

↓

Open Catalog Task

↓

Check Short Description

↓

Check Assignment Group

The PDF specifically instructs the user to open the Requested Item and inspect the Catalog Tasks section to verify the updated status, short description, and assigned group.

11. Security and Access Design

The project PDF specifies that the Flow Designer flow should run as the **System User**. The flow is also configured under the **Global** application.

The design therefore uses the ServiceNow platform's configured access and workflow environment for executing the automation.

Specific authentication mechanisms, encryption requirements, or additional security controls are **not specified in the provided project PDF**, so they are not added to this design.

12. Design Output

The final design provides a direct automated path from a Standard Laptop request to a Hardware configuration task:

Standard Laptop Request

- **Approval**
- **Flow Designer**
- **Create Catalog Task**
- **Hardware Assignment**
- **Laptop Configuration**

This design supports the project's stated objectives of reducing manual intervention, improving resource utilization, reducing user waiting time, and improving IT procurement efficiency.

13. Design Phase Conclusion

The Design Phase establishes the structure of the automated Standard Laptop procurement system. The design integrates the Service Catalog, approval process, Flow Designer, Requested Item Record, Catalog Task, and Hardware assignment group into a single workflow.

The resulting design provides an automated mechanism for generating and assigning laptop configuration tasks, addressing the manual overhead and delays identified in the existing procurement process.
