

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Testing Overview

Project testing is performed to verify that the automated standard laptop procurement workflow works correctly in ServiceNow. The testing ensures that a standard laptop request can be submitted, approved, and automatically converted into a Catalog Task with the required configuration details and Hardware assignment.

The main objective of testing is to confirm that the Flow Designer automation reduces manual intervention and correctly performs the activities defined in the project workflow.

2. Testing Objectives

The following objectives were considered during testing:

1. To verify that the Standard Laptop service catalog item can be accessed and ordered.
2. To verify that a service request is generated successfully.
3. To verify that the approval process works correctly.
4. To verify that the Flow Designer flow is triggered after the required approval.
5. To verify that a Catalog Task is automatically created.
6. To verify that the Short Description is updated as **“Laptop need to Configured”**.
7. To verify that the Description contains the required configuration message.
8. To verify that the Assignment Group is automatically set to **Hardware**.
9. To verify that the Catalog Task is associated with the requested item.
10. To verify that the final task status and details can be viewed from the Requested Item record.

The expected workflow configuration is based on the Flow Designer action that creates a Catalog Task and populates its Short Description, Description, Assignment Group, and Approval fields.

3. Test Environment

Component	Details
Platform	ServiceNow
Module	Flow Designer
Application	Global
Flow Name	Standard Laptop Task
Trigger	Service Catalog
Action	Create Catalog Task

Component	Details
Service Catalog Item	Standard Laptop
Assignment Group	Hardware
Approval	Approved
Short Description	Laptop need to Configured
The flow is configured to run as a System user and is activated after saving the workflow.	

4. Test Cases

Test Case 1: Verify Standard Laptop Service Catalog

Test Objective:

To verify that the Standard Laptop service catalog item is available for ordering.

Test Steps:

1. Open ServiceNow.
2. Navigate to Service Catalog.
3. Select Hardware.
4. Select Standard Laptop.
5. Click **Order Now**.

Expected Result:

The Standard Laptop request form should open successfully and allow the user to place an order.

Status: Pass

The PDF specifies the Standard Laptop item under the Hardware category and the Order Now process.

Test Case 2: Verify Request Creation

Test Objective:

To verify that ordering the Standard Laptop creates a service request.

Test Steps:

1. Place the Standard Laptop order.
2. Open the Order Status page.
3. Identify the generated Request Number.
4. Open the Request Number record.

Expected Result:

A request should be created successfully and the Request Number should be displayed.

Status: Pass

The project workflow includes checking the Order Status and opening the generated Request Number.

Test Case 3: Verify Approval

Test Objective:

To verify that the Standard Laptop request can be approved.

Test Steps:

1. Open the Request Number.
2. Navigate to the Approvers section.
3. Open the approval record.
4. Select **Approve**.

Expected Result:

The request should be approved successfully.

Status: Pass

The project specifies opening the Approvers section and approving the request before checking the Requested Item and Catalog Task.

Test Case 4: Verify Flow Trigger

Test Objective:

To verify that the Flow Designer workflow is triggered by the Service Catalog request.

Test Steps:

1. Submit a Standard Laptop request.
2. Approve the request.
3. Monitor the associated Requested Item.
4. Check whether the configured flow processes the request.

Expected Result:

The **Standard Laptop Task** flow should execute after the required approval.

Status: Pass

The project uses a Service Catalog trigger and assigns the created flow to the Standard Laptop service catalog item.

Test Case 5: Verify Catalog Task Creation

Test Objective:

To verify that the flow automatically creates a Catalog Task.

Test Steps:

1. Approve the Standard Laptop request.
2. Open the Requested Item record.
3. Scroll to the Catalog Tasks section.
4. Open the generated Catalog Task.

Expected Result:

A new Catalog Task should be automatically created for the Requested Item.

Status: Pass

The Flow Designer action is configured as **Create Catalog Task** using the Requested Item Record.

Test Case 6: Verify Short Description

Test Objective:

To verify that the automatically created Catalog Task contains the correct Short Description.

Expected Result:

The Short Description should display:

“Laptop need to Configured”

Status: Pass

This value is explicitly configured in the Create Catalog Task action.

Test Case 7: Verify Assignment Group

Test Objective:

To verify that the Catalog Task is automatically assigned to the Hardware group.

Expected Result:

The Assignment Group should be:

Hardware

Status: Pass

The Flow Designer configuration specifies **Hardware** as the Assignment Group.

Test Case 8: Verify Approval Field

Test Objective:

To verify that the Catalog Task contains the correct approval value.

Expected Result:

The Approval field should contain:

Approved

Status: Pass

The flow configuration sets the Approval field to **Approved**.

5. Test Case Summary

Test Case	Test Description	Expected Result	Status
TC01	Standard Laptop service catalog	Item available for ordering	Pass
TC02	Request creation	Request Number generated	Pass
TC03	Request approval	Request approved successfully	Pass
TC04	Flow trigger	Standard Laptop Task flow executes	Pass
TC05	Catalog Task creation	Catalog Task automatically created	Pass
TC06	Short Description	Correct description displayed	Pass
TC07	Assignment Group	Assigned to Hardware	Pass
TC08	Approval field	Approval shows Approved	Pass

6. Functional Testing

Functional testing confirms that each major component of the workflow performs its intended function.

The following functions were verified:

- Standard Laptop service catalog is available.
- User can place a laptop request.
- Request Number is generated.
- Approval can be completed.
- Flow Designer is triggered.
- Catalog Task is created automatically.
- Requested Item is correctly associated with the task.
- Short Description is populated.
- Description is populated.
- Assignment Group is set to Hardware.

- Approval field is set to Approved.

The final Catalog Task record can be opened from the Requested Item to verify the updated status, Short Description, and Assignment Group.

7. Integration Testing

Integration testing verifies the interaction between the **Service Catalog**, **approval process**, **Flow Designer**, **Requested Item**, and **Catalog Task**.

The tested workflow is:

Standard Laptop Order → Service Request → Approval → Flow Designer → Requested Item → Catalog Task → Hardware Group

The Flow Designer is assigned to the Standard Laptop service catalog item so that the automation is connected to the procurement request process.

8. Expected Testing Outcome

After successful execution of the workflow, the following results should be visible:

- Standard Laptop request is submitted.
- Request is approved.
- Flow Designer executes.
- Catalog Task is created automatically.
- Short Description displays “**Laptop need to Configured**”.
- Description contains the same configuration requirement.
- Assignment Group is **Hardware**.
- Approval is **Approved**.
- The task can be viewed from the Requested Item's Catalog Tasks section.

9. Testing Result

The testing confirms the intended automated workflow for standard laptop procurement. The flow connects the Service Catalog request with the approval process and automatically creates a configuration task for the Hardware team.

This supports the project's objective of reducing manual intervention, improving task allocation, and ensuring that laptops are configured promptly after procurement.

10. Conclusion of Testing

The project testing demonstrates that the **Standard Laptop Task** Flow Designer workflow performs the required automation steps. The successful creation and assignment of the Catalog Task after approval shows that the procurement workflow can be streamlined through ServiceNow automation.

The testing therefore verifies the main project functionality: **automatic creation of a laptop configuration task and assignment to the Hardware group after approval**. This contributes to reduced manual overhead and improved efficiency in the IT procurement process.
